HIGHLIGHTS

- Microprocessor controlled with automatic self-calibration on start up
- Wear-free distance measuring system - no potentiometer
- LED indication of actuator status
- Permanent storage of stroke in EPROM memory, values can not be lost
- Wire break recognition in 2..10 VDC and 4...20 mA operation
- Bonnet detachable in four positions, 90° locking, no screws required
- Safety position for switching a binary signal (frost safety)
- Pull-out manual adjustment with message signal
- Fault recognition in continuous operation (in case of blockage by foreign bodies)
- Input and output signal independently reversible
- Hysteresis and characteristics freely adjustable
- Shockproof at 230 VAC, no protective conductor (PE) necessary

DESCRIPTION

The microprocessor controlled actuators, series 500.. and 503.., are designed for use on control valves in HVAC plants.

The rotary motion of the stepping motor is converted into a linear movement via a planetary gearing and a threaded stem with stem nut.

Modulating operation as well as on/off or 3-point control is possible. In both modes a load-dependent blocking detection switches off as soon as one of the two end positions is reached, or blocking occurs due to overload.

The series 500.. and 503.. offer a 5000 N push and pull force for a 60 mm stroke at maximum.

3-point control

By connecting a 3-point control signal to the 3P input, the direction of motion of the linear actuator and thus of the valve can be determined directly.

Modulating control signal (Y)

The electronic positioner of the actuator compares the setpoint input signal (Y) with the actual value of the valve (stroke) specified by the controller of the system. In case of a deviation, the actuator is triggered until conformity between set value and actual value is achieved.

The sense of action of the input signal (direct control or indirect control) can be reversed if necessary.

Broken wire detection

When the input signal Y is interrupted during 0..10Vdc or 0..20mA operation, the linear actuator moves into the 0 Volt position.

When the input signal Y is interrupted during 2..10Vdc or 4..20mA operation, the linear actuator moves into the end position which can be preselected.

An LED signals the warning : "broken wire detected".

Feedback signal

The actual position of the valve is available as an analog output signal (X) 0..10Vdc (0..100%).
PRODUCT KEY

The product identification key contains all essential data defining the unique features of the valve actuator.

Example: type 500U42

- **Enclosure protection:** IP 54
- **Resolution:**
  - electric ≤ 0.04 VDC
  - mechanical ≤ 0.04 mm
- **Operating mode:** S3-50% ED c/h 1200 EN 60034-1
- **End position switch-off:** load-dependent
- **Ambient temperature:** 0...+50°C
- **Weight:** 500.. (24V) 7.0 kg, 500.. (230V) 8.2 kg

### Actuator variant and accessories

- **Voltage:** 115 VAC
- **Position switch unit:** 2 switches (WE1/WE2), potential free, infinitely adjustable
  - Rated load: 8 A / 250 VAC
  - 8 A / 30 VDC
  - Turn-on voltage: max. 400 VAC
  - max. 125 VDC
- **Enclosure protection:** IP 65
- **Output signal:** X=0(4)...20 mA
- **Distance pillars, traverse and all screws located on exterior made of stainless steel**
- **Adapter with coupling for third party products**

---

1) Actuating time freely adjustable, presetting is marked with *
2) Please state when ordering, which kind of direct-current
1. smooth direct current or
2. rectified alternating voltage
3) Invertible input and output signal
4) Freely adjustable

N2 is the zero potential for the "X", "Y" and "R" signals.
- 24 VAC(DC) : it is recommended to connect N2 in case of actuators in 24 VAC(DC) design.
ELECTRICAL WIRING

AC 24 VOLT 3-POINT CONTROL SIGNAL

N2 is the zero potential for the _X_-, _Y_ and _R_ signals.
- 24 VAC(DC): it is recommended to connect N2 in case of actuators in 24 VAC(DC) design.
- 230 VAC: if the actuators in 230 VAC design are to be triggered on the "continuous" mode of operation, i.e. by analogue signal _Y_, the connection of N2 (zero potential of the controller) is absolutely necessary. For actuators in 230 VAC design the connection of N2 in the "3-position" mode of operation is only necessary if _X_ and/or _R_ are to be used by the actuator. If the zero potentials of the signals _X_, _Y_ and _R_ are identical with the zero potential of the supply voltage, a bridge can be laid between N1 and N2 in order to save an additional lead to N2.

APPLICATION EXAMPLE

COMMON MASS CONNECTIONS SHOULD ALWAYS BE RESPECTED!

B1/B2 Connection of a binary signal (e.g. frost safety)

When the current flow between the terminals B1 and B2 is interrupted, the actuator moves into the end position preselected by S6 dip-switch. Circuit interruption between B1-B2 has priority above all other input signals.

In 3-point control mode the last position of the stem before switching event is stored and is started up again automatically after the circuit interruption is restored.

INITIALIZING - COMMISSIONING

During initial commissioning and after repairs, initialization of the incremental travel measuring system is required.

The INIT (initialization) key on the PCB board or simultaneous signal on terminals 2 and 3 serves to trigger initialization.

By pressing the INIT key >3s (until the actuator starts running), the exact travel length of the valve is measured and stored in the microcontroller for accurate operation.

When applying simultaneous signal on terminals 2 and 3, the signal must be applied for >3s at least.
